                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention provides a nucleic acid encoding a signal transduction protein involved in the process of dehiscence. The nucleic acids and proteins are useful for regulating or controlling dehiscence of a pod or an anther in a plant, useful in the production of male sterile plants. The methods, etc. may be used in production of shatter resistance or shatter-delayed plants such as oilseed rape (Brassica napus). The present sequence represents a B. napus response regulator protein DZ2.

The invention provides a nucleic acid encoding a signal transduction protein involved in the process of dehiscence. The nucleic acids and proteins are useful for regulating or controlling dehiscence of a pod or an anther in a plant, useful in the production of male sterile plants. The methods, etc. may be used in production of shatter resistance or shatter-delayed plants such as oilseed rape (Brassica napus). The present sequence represents a D22 A. thaliana homologue D22AT3 putative peptide sequence.

The nucleic acids and proteins are useful for regulating or controlling dehiscence of a pod or an anther in a plant, useful in the production of male sterile plants. The methods, etc. may be used in production of shatter resistance or shatter delayed plants such as oilseed rape (Brassica napus). The present sequence represents the B. napus D22B putative peptide sequence.

ANA 9263 to AAA 9736 and AAB 25100 to AAB 25570 represent polynucleotide and protein sequences isolated from eucalyptus (Eucalyptus grandis) or pine (Pinus radiate also known as Monterey pine). The protein sequences are involved in cell signalling. The polynucleotide and protein sequences can be used to modify the response of plant cells to external signals e.g. environmental changes or pathogens during the growth and development of a plant. They can be used to modify cell proliferation, differentiation, elongation and survival, resistance to disease and contribent metabolism. Examples of modifications which can be produced are altered fruit ripening and senescence of leaves and flowers e.g. to delay senescence and prolong the life of cut flowers or enhance and prolong the life of cut flowers or enhance of reproductive organs to engineer sterile plants. Other modifications can be used to delay senescence in selected cell types or organs providing fruit and vegetables which have a longer shelf life forest tree species giving long stretches of valuable knot-free clear coord which can be used in solid timber furniture and veneers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         18 VLIVDDDPLNLIHEKIIKAIGGISQTANNGEEAVIIHRDGGSSFDLILMDKEMPERDGV 77

The invention provides a nucleic acid encoding a signal transduction protein involved in the process of dehiscence. The nucleic acids and proteins are useful for regulating or controlling dehiscence of a pod or an arither in a plant, useful in the production of male sterile plants. The methods, etc. may be used in production of shatter resistance or shatter-delayed plants such as oilseed rape (Brassica napus). The present sequence represents the partial fragment of B. napus DZ2B protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RscC; antagonist; agonist; cytokinin receptor; receptor; signal transduction; histidine kinase; hormone; cell division; cell differentiation; agriculture; growth regulator; harvest.

The invention discloses a method for analysing antagonist or agonist

activity to a cytckinin receptor. The method comprises bringing a
candidate substance into contact with a transformed cell, in which a DNA
candidate substance into contact with a transformed cell, in which a DNA
candidate substance into contact with a transformed cell, in which a DNA
concoling the receptor has been introduced, and then measuring the
existence, or the quantity, of the intracellular signal transduction from
the receptor expressed in the cell. The cytchinin receptor comprises an
extracellular region of the receptor, transmembrane regions, a histidine
kinase region and a receiver region of the kinase. The transmembrane
cell division and differentiation of higher plants. The method is used
to cell division and differentiation of higher plants. The method is used
for analysing agonist or antagonist activity to a cytckine receptor. A
substance with agonist or antagonist activity to a cytckine receptor. A
substance with agonist or antagonist activity to a cytckine receptor on be
used, in agriculture, as a plant growth regulator, e.g. after harvest.
The advantage is that the candidate substances do not need to be prepared
in such large amounts as in previous methods and that the method avoids
the immensely long time to observe and evaluate the growth of the plant
and the physicalogical changes of the plant after spraying. The sequence
presented is the B. coli receiver region of histidine kinase which can
transmit signals to the cytokinin receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          18 VLIVDDDPLNLIIHEKIIKAIGGISQTANNGEEAVIIHRDGGSSFDLILMDKEMPERDGV 77

                                                                                                                                                                                                                                                                                                                         The invention relates to a novel isolated polypeptide comprising a PvrR (variant Pseudomonas) amino acid sequence having at least 50 % identity to a 399 residue amino acid sequence, given in the specification, where expression of the polypeptide, in a microorganism, affects phenotypendiated antibiotic resistance in the microorganism. The methods and compositions of the present invention are useful for the diagnosis, prevention and treatment of gram negative or gram-positive bacterial infection. This sequence repersents a Pseudomonas protein used in the exemplification of the invention.
                                                                                                                                                                                                                     New isolated PvrR polypeptide and polynucleotide that regulates bacterial biofilm formation, useful for the diagnosis, prevention and treatment of gram-negative or gram-positive bacterial infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GENERAL INFORMATION:
APPLICANT: MARC J. Rubenfield et al.
APPLICANT: MARC J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS.
TILE REPERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR PLICING DATE: 1999-02-18
PRIOR PLICING DATE: 1998-02-18
PRIOR PLICING DATE: 1998-02-18
PRIOR FILING DATE: 1998-07-7

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Comparative genomics of Salmonella enterica serovar Typhi strains Ty2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         --- PTM: Activation probably requires a transfer of a phosphate group between a His in the transmitter domain and an Asp of the receiver domain (By similarity)
--- SIMILARITY: Contains 1 histidine Kinase domain.
--- SIMILARITY: Contains 1 PAS (PER-ARNT-SIM) dimerization domain.
--- SIMILARITY: Contains 1 response regulatory domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     J. Bacteriol. 178:1691-1698(1996).

-i. FUNCTION: Member of the two-component regulatory system rcsC/rcsB intolved in the regulation of the expression of genes involved in colanic acid capsule synthesis. RcsC probably functions as a membrane-associated protein kinase that phosphorylates rcsB in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Parkhill J., Dougar G., Thomson N.R., Pickard D., Wain J Churcher C., Mungall K.L., Bentley S.D., Holden M.T.G., Sebaihia M., Baker S., Basham D., Brooks K., Chillingworth T., Connerton P., Cronin A., Davis P., Brooks K., Chillingworth T., Connerton P., Feltwell T., Hamlin N., Haque A., Hien T.T., Holroyd S., Jagels K., Kroph A., Larsen T.S., Leather S., Moule S., O'Gaora P., Parry C., Quail M., Rutherford K., Simmonds M., Skelton J., Stevens K., Mhitehead S., Barrell B.G.; Eacher S., O'Gaora P., Parry C., Complete genome sequence of a multiple drug resistant Salmonella enterica serovar Typhi CTIB.",

SIMILARITY: Contains I histidine kinase domain.

SIMILARITY: Contains I PAS (PER-ARNT-SIM) dimerization domain.

SIMILARITY: Contains I response regulatory domain.

The Purification and characterization of the Myxococcus xanthus Frze

The Purification and characterization of the Myxococcus xanthus Frze

The Profesin shows that it has autophosphorylation activity.";

The Bacteriol. 172:6661-6668(1990).

-!- FUNCTION: FRZE IS INVOLVED IN A SINSORY TRANSDUCTION PATHWAY THAT

CONTROLS THE FREQUENCY AT WHICH CELLS REVERSE THEIR GLIDING

DIRECTION: FRZE SEEMS TO BE CAPABLE OF AUTOPHOSPHORYLATING ITSELF

ON AN HISTIDINE RESIDUE AND THEN TO TRANSFER THAT GROUP TO AN

ASPARTATE RESIDUE IN THE C-TERMINAL PART OF THE PROTEIN.

-!- SIMILARITY: Contains 1 histidine kinase domain.

C-!- SIMILARITY: Contains 1 histidine kinase domain.

C-!- SIMILARITY: Contains 1 response regulatory domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESPONSE REGULATORY.

D 55:1842-1849(1999).

Acta Crystallogr. D 55:1842-1849(1999).

-!- FUNCTION: Member of the two-component regulatory system arcB/arcA.

Sensor-regulator protein for anaerobic repression of the arc
modulon. Activates arcA via a four-step phosphorelay. ArcB can
also dephosphorylate arcA by a reverse phosphorelay involving His-
717 and Asp-576.

-!- SUBCELLULAR LOCATION: Integral membrane protein. Inner membrane
                                                                                                                                                        SPECIES=E.Coli, STRAIN=M15;

"Cold shock stress-induced proteins in Bacillus subtilis.";
J. Bacteriol. 178:4611-4619(1996).
I. PUNCTION: HAS A CENTRAL CONTROLLING ROLE IN CHEMOTAXIS.
II IS HOMOLOGOUS TO THE CHEY PROTEIN OF OTHER BACTERIA,
THOUGHT TO FUNCTION IN A DIFFERENT MANNER.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -:- SUBCELLULAR LOCATION: Cytoplasmic.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
